GreenIT Audit: UGC.fr

Eco-design of Digital Services

A. El Bakali, B. Hubert, C. Kelma, N. Eudeline, P. Pousset, M. Fordelone

ISEN - Module Numérique Responsable

Context & Scope

The Persona

Student (-26y)
Uses a Desktop PC.
Has a tight budget.
Impatient: Wants a ticket for **tonight**.

The Goal

Book 1 ticket
“Film Nouveauté”
UGC Ciné Cité Lille

We audited the full desktop journey: From Landing Page to Payment.

The Functional Unit

“Booking 1 discounted ticket for a New Release movie at UGC Lille”

The User Journey

We identified **9 Steps**. Standard is usually 5.

1. Home (Cookie Wall)
2. Movie Selection
3. Schedule Filter

→

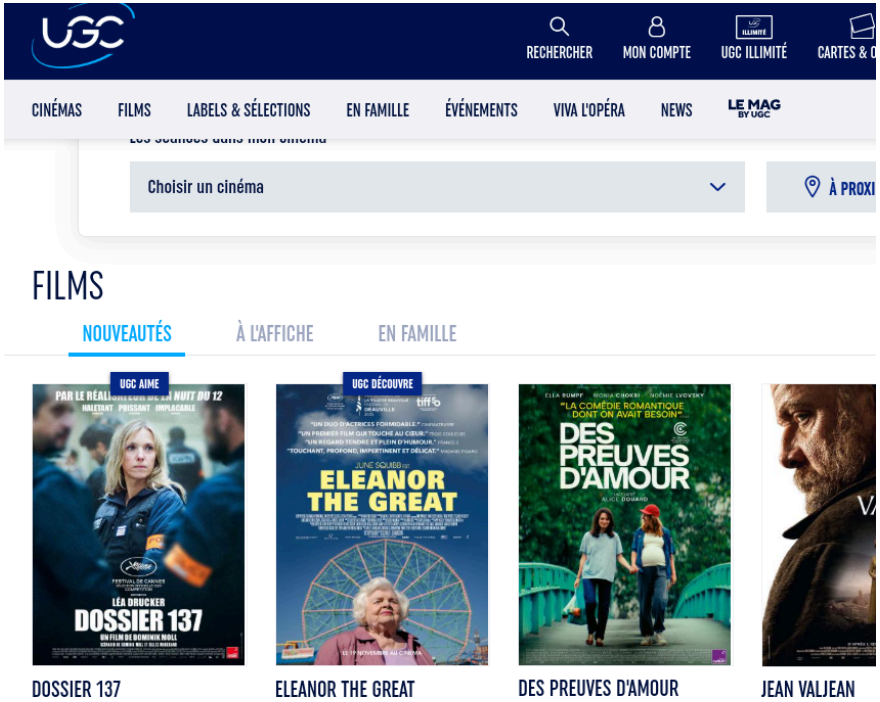

4. **Auth (Mandatory)**
5. Tariff (-26y)
6. Seat Map

↓

7. **Upsell (Food)** → 8. Recap → 9. Payment

Friction Points: Mandatory Account Creation & Full Page Food Upsell.

Functional Analysis: Visual Clutter

The “Discovery” Phase

We applied the **C.O.E.U.R** method to the landing pages.

- **Clutter:** The Cookie Banner covers 30% of the viewport on entry.
- **Navigation:** The “Nouveautés” Carousel is **not scrollable**.
- **Conceal:** Clicking a movie poster doesn’t select it; it opens a preview, adding an unnecessary click.

Functional Analysis: The Blockers

The “Conversion” Phase

Two major functional flaws detected:

1. **Mandatory Account:** No “Guest Checkout”. User **must** create a password to buy a €10 ticket.
2. **The Upsell Page:** A dedicated page load just for food.

Users often click “Continue” without looking, making this page “Digital Waste”.

Global Grade: D

Marketing Pages:
Grade F (Home, Movie)

Booking Engine:
Grade C (Auth, Payment)

Total Impact per Ticket

- **Weight:** 24.85 MB
- **Requests:** 583
- **GHG:** 15.63 gCO2e
- **Water:** 23.44 cl

A single ticket consumes 25MB of data. That is huge.

Annual Projection

Hypothesis: **15 Million** visits/year.

234 Tonnes CO2e
(2 million km in a car)

3,500 m³ Water
(1.5 Olympic Pools)

Buying 1 ticket = Driving **70 meters**.

Why is it so heavy?

We identified 3 main technical culprits:

1. **Unoptimized Images:** Potential gain of **1.7 MB** just by compressing Home/Movie assets.
2. **The “Upsell” Anomaly:** Step 7 downloads **2.35 MB** of food images. **If the user refuses food, this is 100% digital waste.**
3. **Legacy Stack:** The booking tunnel (`.action` URLs) sends heavy headers and unminified code for very simple forms.

Quick Wins (Eco-Redesign)

Level 1: Technical

- **Compress Images:** WebP format for posters.
- **Cache Control:** Add expires headers for static assets.

Quick Wins (Eco-Redesign)

Level 2: Architecture

- **Lazy Loading:** Don’t load the “New Releases” carousel images until user interacts.
- **Merge Steps:** Integrate “Food Options” into the “Tariff” page.
- **Gain:** **Save 1 full page load (2.3 MB).**

Innovation (Functional)

Level 3: Functional

Remove the biggest friction: **Guest Checkout**.

Allow booking without account creation for one-off users.

Level 4: Radical

UGC Lite Mode

Text-only interface:

1. City > Tonight
2. Movie > Pay

Gain: < 1MB total journey.

Conclusion

The UGC journey is bloated by marketing assets and legacy constraints.

Removing the **Account Requirement** and the **Upsell Page** could save **20%** of emissions.
