DIGITAL PUBLIC INFRASTRUCTURE (DPI), GOVERNANCE, LONG-TERM STABILITY, AND TRUST

THE ARCHITECTURES OF AUTONOMY

FRENCH PUBLIC DIGITAL INFRASTRUCTURE & THE SOVEREIGN CLOUD

Reflecting on Strategic Autonomy: Governance, Architecture, and Responsibility over Technology Hype.

Digital Trust Shift

Shift from physical docs to **Digital Public Infrastructure (DPI)**. Trust anchored in governance-backed verification.

Open Source Strategy

Strategic Non-Dependence. Using **OpenStack** (Nubo) & **Matrix** (Tchap) to ensure auditability and avoid vendor lock-in.

Longevity Design

Architectural Minimalism. Infrastructure must **outlive political cycles** and technology hype.

THE DOCTRINE

Realigning the state relationship with global tech.
Cloud as default for new digital services.

STRATEGIC AUTONOMY

SecNumCloud 3.2

The Trusted Fortress. Requirements: Legal Immunity (No US CLOUD Act), <24% non-EU capital, & EU-resident operations.

THE ARCHITECTURE

A dual approach to sovereignty balancing security and functionality.

INTERNAL	TRUSTED
State-Operated	SecNumCloud 3.2
Air-Gapped	EU Immunity

THE PHILOSOPHY

Governance First. Infrastructure for Decades, not Demos.

BORING IS GOOD

- No neutrality in design.
- **Sovereign Keys** are essential.

The AI Frontier

Sovereignty as Industrial Policy. Using **SREN Law** to break lock-ins and funding sovereign AI (e.g., **Mistral**) & GPU capacity.

Blockchain Nuance

Blockchain as **Verification Bus**, not storage. Identity is a first-class component; no speculative tokens in DPI.

THE FUTURE

Moving beyond silos to verification buses. Aligning with **eIDAS** and **EBSI**.

INTEROPERABILITY →

ULTIMATE GOAL: A resilient, accountable public infrastructure where the State retains final authority over its data, laws, and digital future.
